

## SAT order extraction update

1. Dataset : 27 docs (IndianKanoon) 8 docs (SEBI) Total : 35 SAT orders - Added to Github
2. Complete code with documentation - Added to Github
3. Extraction results from both sets of documents - Added to Github
4. Evaluation :
  - Done for 8 SAT orders - SEBI (manually scored) - Added to Github

To do:

1. Annotation (delayed due to docker issue)
2. A more efficient way to score entities

Reason for flawed scores in the SEBI - entity bench name

- Recurring name identified as ORG instead of PER
